

**Round Table Topic:** Pediatric Oncology Emergencies: Satellite Case Examples

**Facilitator:** Kirsty Morelli, BScN, MN, NP-Pediatrics, CPHON

## Background

*Why is this topic important? What is the context around this issue?*

The success of pediatric cancer therapy is owed in large part to the intensity of therapy. Unfortunately, this also means that a variety of emergent situations arise when caring for these patients. While fever and neutropenia is the most common emergent situation seen in satellites, there are many other possible presentations. This round table will review 3 different emergent presentations and discuss their management.

## Learning Objectives

*What can participants expect to learn from this discussion?*

1. Discuss the differential diagnoses and management of a pediatric cancer patient presenting with worsening respiratory distress.
2. Review the potential causes and initial management of a pediatric cancer patient presenting with renal failure
3. Describe the approach and potential causes of seizure in patients receiving cancer therapy.
